FOREWORD

The information contained in this bulletin deals with the financial support, the financial ability and inequalities existing in the various school districts of this Commonwealth. It was prepared by Mr. George L. Evans, Director of the Division of Finance. It contains information of interest and value to school administrators, teachers, patrons, boards members and all persons interested in the development of our public school system.

Because of the importance of the information contained herein I earnestly solicit your careful consideration of the facts presented. I invite your comment and suggestions.

FINANCIAL SUPPORT, FINANCIAL ABILITY, AND INEQUALITIES EXISTING IN VARIOUS SCHOOL SYSTEMS IN KENTUCKY

Introduction

This bulletin is being published to release information and data concerning the public school system of Kentucky. Data and treatment are divided into three sections. Part I deals with the number of teachers and teachers' salaries for the school year 1937-38. Part II gives information concerning the teaching term of all teachers in all districts for the school year 1937-38. Part III is given over to information concerning financial support of education in Kentucky by both the state and the local districts for 1938-39. All information and data are reducible to records and reports now on file in the State Department of Education.

Part I

Of the 18,555 teaching positions in Kentucky, as shown by the salary schedules of all districts for 1937-38, 12,477 are in county school districts, 1,214 in independent school districts not embraced in cities of the first four classes, and 4,864 in independent school districts in cities of the first four classes.

Method of treatment.—The salary schedule for every school district was considered. All monthly salaries have been translated to annual salaries. The teacher has been classified as to race, sex, teaching level, and annual salary interval.

Referring to Table 1, it is seen that the typical teacher in the county system receives \$606 per year. By referring to Table 2, it is seen that the typical teacher's salary in independent school districts not embraced in cities of the first four classes is \$826, while the annual salary for the typical teacher in districts embraced by cities of the first four classes is \$1,244—Table 3.

This difference is brought about by two causes: (1) the actual amount of money paid in monthly salaries and (2) the difference in the length of school term.

The median salary for all teachers in all districts, as shown by the salary schedules for the year 1937-38, is \$717—Table 4. Interesting information is given by this table when it is seen that 38 full-time teachers receive less than \$350 per year. Using \$336 as the average

for the 38 teachers in the interval range from \$300.00 to \$349.99, it is seen that these teachers receive less than \$6.50 per week when based on fifty-two weeks in the year.

Further inspection reveals that 3,018 teachers receive less than \$500 per year. Using the median for this group, it is found that \$456 would represent the annual salary for the typical teacher falling in this division, which means that these teachers receive a weekly wage of \$8.75 based on fifty-two weeks. Anyone who will stop to analyze these facts will readily see that it is impossible for these teachers to maintain a decent living standard, much less leave any surplus for professional growth.

This can mean only one of two things: (1) the teacher is poorly trained, or (2) teaching is a side-line, with the teacher receiving an income from other sources, either in the form of personal assistance from parents or relatives, or that the teacher is expending a part of her energy in other work. In either event the teaching profession does not support her, and it is doubtful whether the profession is benefited as much as it should be by her services.

In Table 5 data are treated with only one result in view; namely to show the number of men teachers and the number of women teachers and the salary intervals into which each falls. Note that the typical man teacher, regardless of race or teaching position, receives \$728 while the typical woman teacher receives \$714. This is considered evidence that the single salary-schedule plan is functioning.

Table 6 is displayed to show the number of white teachers and the number of colored teachers and the corresponding medians.

In Table 7 these data have received such treatment as to show the number of elementary teachers and the number of high-school teachers. The treatment here does not take into consideration sex or teaching position. It is desirable to point out that the typical elementary teacher receives an annual salary of \$626, whereas the typical high-school teacher receives an annual salary of \$1,073. It is the judgment of the writer that this table reveals the most discriminating practice carried on in the educational system of Kentucky. Only a fractional part of the difference represented by these two typical salaries is in actual monthly salaries. The greater part of it is brought about because of difference in term length. It has been the general practice in a great many districts to operate the elementary schools for a seven-month period and the high schools for a nine-month term. This fact when considered in the annual salary of the teacher, reflects considerable difference.

However, it is only fair to point out that included in data sup

porting the annual salary of the typical high-school teacher are principals, coaches, vocational agriculture teachers, and home economics teachers who invariably receive a higher salary than do the other high-school teachers; and that high-school teachers are considerably better trained than elementary teachers.

Tables 8, 9, and 10 are given space to show the salary classification of all teachers in all school districts in the Commonwealth. Note that these tables divide the teachers by race and show the annual salary but do not show the teaching level.

Part II

The data used in Part II of this bulletin are from the same source as the data contained in Part I. All of this information has for its foundation the salary schedules of all school districts of the Commonwealth for 1937-38.

Treatment.—The period of teaching employment for every teacher has been broken into four major sections. Table 11 points out the number of teachers and the teaching terms for the county school districts. Table 12 gives the same information for independent school districts not embraced in cities of the first four classes, while Table 13 reflects the same data and the same treatment for school districts in cities of the first four classes. Table 14 is simply a summary of the data and treatment, and reflects the information concerning term of employment for all teachers in all districts.

Referring to Table 11, it is seen that the range is from five months to twelve months in county school districts. It is necessary to point out that the 33 cases shown in the five-month term and the 11 cases in the six-month term do not represent the term of school but do represent the employment term of the teacher. In these districts extra teachers are employed at the beginning of the school while the attendance is heavy, and the services of the extra teacher is discontinued when the attendance falls to a point where one teacher can take care of the school.

It is desirable to call to the reader's attention that of the 12,477 teaching positions in the county school system, 7,360 are maintained for a period not in excess of seven months.

Considering this table again, it is seen that the average term of teacher employment, expressed in months, in the white elementary schools is 7.39, for the colored elementary teachers 7.55, for the white high-school teachers 9.15, for the colored high-school teachers 9.06, and for the total number of county teaching positions 7.71.

Table 12 shows a much more wholesome picture. Of the 1,214

teachers employed in districts of this classification, it is pleasing to note that 1,177 have an employment term of nine months or more. It is interesting to compare the average length of term for the county district and the average length of term for the independent districts not embraced in cities of the first four classes. The average term is 1.38 months longer in these independent districts than in the county districts.

By inspecting Table 13, it is seen that the period of employment for the independent districts embraced in cities of the first four classes is considerably longer than in other school districts. Here no teacher has a term of employment less than nine months, while the average for this entire group of teachers is 9.58.

Turning to Table 14, it is seen that the typical teacher in the state of Kentucky has a term of employment amounting to 8.29 months. This when considered with the typical salary of \$717 per year gives a fair picture of both the opportunity afforded the average pupil and the measure of economic security afforded the typical teacher.

Part III

All data and information contained in Part III of this bulletin are submitted to show the financial support, financial ability, and inequalities existing in various school systems in Kentucky.

Table 15 is given space to show the per census pupil assessment of corporate and non-corporate property in every county school district. The writer has not considered income from poll tax nor has income from a levy on bank shares been considered, neither has any allowance been made to take care of collection of school taxes and delinquent taxes. Most districts have a poll tax; some do not. Many districts do not request a levy on bank shares. Therefore, in order to keep the foundation data on the same level for all districts, only the assessment as indicated on general property and the assessment of taxpaying franchise corporations have been considered.

In many county school districts, special taxes are levied in sub-districts. The proceeds of such levies have not been considered in this treatment. However, districts that do have special subdistrict taxes are indicated, as pointed out by information note 5, Table 15.

No particular comment is necessary on this table except to bring to the attention of the reader the two extreme cases which establish the range; namely, that Woodford County has a per census pupil assessment of \$10,307, while Wolfe County has a per census pupil assessment wealth of \$286, or a range of \$10,021.

Table 16 is displayed to give the same information in independent

school districts not embraced in cities of the first four classes as has been given in the counties, as set forth by Table 15. Here the range, although enormous, is slightly less pronounced than in the counties. To arrive at this range, compare Anchorage with a per census pupil assessment of \$8,608 with Gatliff with a per census pupil assessment of \$150. The range in this group of districts is \$8,458.

To complete this type of information, Table 17 is displayed, which gives the same information for the independent school districts embraced in cities of the first four classes. For the sake of easy comparison, the cities have been arranged by respective classes. To find the range of \$7,648, compare the assessed per census pupil wealth of Fort Thomas, \$8,407, with Corbin, \$759.

Table 18 is a simple summary of the information contained in Tables 15, 16, and 17. In order to display two measures, both the median and the mean are given; also the range is shown for each particular group of districts as well as displaying the same information for the entire public school system of the state.

It is interesting to note that the same relationship expressed by the per census pupil assessed wealth is approximately the same as the relationship expressed in teacher-employment term, as shown in Tables 11, 12, and 13. To illustrate, the median for the assessed wealth per census pupil in the county is \$1,500; the average term of teacher employment in the counties is 7.71. For the independent school districts not embracing cities of the first four classes, the median for the assessed wealth per census child is \$1,833; whereas the average term of teacher employment is 9.09. In independent school districts embracing cities of the first four classes, the median of assessed wealth per census child is \$2,300; whereas the average term in these same districts is 9.58.

Table 19 is displayed to show data and treatment to arrive at one result; namely, to show inequalities in ability to support public education among the various county school districts of the state. Very little explanation seems to be necessary for the interpretation of this table, except to point out the source of the foundation data.

Columns 2 and 3 have for the source data information contained on general budgets received from each of these school districts for the school year 1938-39.

Column 4, which shows the gross income, seems to need little explanation. Possibly it would be well to say again that no allowance has been made for collection of the school tax, nor has any deduction been made for delinquent taxes. However, as pointed out in another part of this bulletin, the proceeds from poll taxes and levies on bank

shares have not been considered; therefore, it is the judgment of the writer that for comparative purposes, the gross income here displayed for each district offers an accurate basis for comparison.

Column 7 gives the amount of the state per capita distribution to each district for the current year, 1938-39.

Column 10, which shows the maximum levy that may be requested for general school purposes in county districts is based on authority as found in Section 4399-40, Kentucky Statutes.

Column 13 probably requires explanation. The school census as of June 1, 1938, shows that the number of children of educable age was 792,079. Using 18,555 as the number of teaching positions in Kentucky, we find that the average number of census pupils taken care of by one teaching position is 42. Dividing the number in the district census by 42 gives the number of teaching positions in each county district, provided the state average is maintained.

Column 14 shows how much money would be required for every district to maintain a program of the same costliness as the average Kentucky program. To arrive at the weighted cost per teaching unit, \$1,148, the amount of money spent for *current school purposes* in both county and independent districts (expenditures for capital outlay, transfer tuition, and debt service not considered) for the year ending June 30, 1938, \$21,317,890.06, was divided by 18,555, which is used as representing the number of teaching positions.

Column 15 shows the amount of money that the district would be required to raise after deducting the state per capita.

Column 16 is used to show the levy that would be required on local property subject to the school tax to produce the amount of money necessary to maintain the average Kentucky school program in every district. This levy is found by dividing the amount of money that the district would be required to raise locally by the assessed valuation, as shown in column 2.

In looking over the information given in column 16, it is seen that one district would be required to make a levy of \$5.26 on each one hundred dollars of assessed valuation subject to the school levy. The making of such a levy is impossible both from the standpoint of legality and practicability. The present law limits the tax to be levied in county districts to \$0.75, while economic ability to pay such a levy would preclude its imposition even though the legal limitations were removed.

Data of independent school districts have not been subjected to the same treatment because of lack of time.

Summary

Thus it is seen that before Kentucky can have equality in educational support and opportunity, new plans and laws must be considered in order that those districts which need assistance beyond their capacity to help themselves may receive that assistance without impairing the efficiency and scope of the educational program in any other school district.

1. The first part of the report is a general introduction to the subject of the study. It discusses the importance of the problem and the objectives of the research. It also mentions the scope of the study and the methods used.

2. The second part of the report is a detailed description of the methods used in the study. It includes a description of the experimental setup, the data collection procedures, and the statistical methods used for data analysis.

3. The third part of the report is a presentation of the results of the study. It includes a description of the data obtained, a discussion of the results, and a comparison of the results with the theoretical predictions.

4. The fourth part of the report is a conclusion and a discussion of the implications of the study. It includes a summary of the main findings, a discussion of the limitations of the study, and suggestions for further research.

Year	1950	1951	1952	1953	1954	1955	1956	1957	1958	1959	1960

Population Density	1,000	1,050	1,100	1,150	1,200	1,250	1,300	1,350	1,400	1,450	1,500
Area per Person	0.001	0.00095	0.0009	0.00085	0.0008	0.00075	0.0007	0.00065	0.0006	0.00055	0.0005

5. The fifth part of the report is a bibliography of the references used in the study. It includes a list of books, articles, and other sources consulted during the research.

6. The sixth part of the report is an appendix containing additional data and figures. It includes a list of tables and figures, and a description of the data presented in each.

7. The seventh part of the report is a list of figures. It includes a list of figures, and a description of the data presented in each.

8. The eighth part of the report is a list of tables. It includes a list of tables, and a description of the data presented in each.

9. The ninth part of the report is a list of references. It includes a list of references, and a description of the data presented in each.

10. The tenth part of the report is a list of figures. It includes a list of figures, and a description of the data presented in each.
