RA638-M-2---SCIENCE BRINGS SANITATION.

At a safe distance from the residential section, a permanent sewage disposal system is being built for Greenbelt. This huge circular tank has been carefully designed for permanence and avoidance of breakdowns and stoppages. A crushed rock filter laid over the broken tile seen in the picture will effectively prevent sludge from stopping the drainage outlets in the bottom of the tank. The layer of broken tiles serves to prevent the necessity of constant sludge removal. Here, too, provisions have been made for any growth of the town. Both the size of the tank and the number of mains laid will accommodate a growing population. (Resettlement Administration Photo)
