THE CHANGING KENTUCKY POPULATION

A Summary of Population Data for Counties

Compiled by James S. Brown and Ralph J. Ramsey

Department of Rural Sociology

Introduction

Here is the material on population you have been asking for. Though compiled mainly from the census, this report also includes data from studies made by the U. K. Department of Rural Sociology, the U. K. Bureau of Business Research, the State Department of Economic Security, the U. S. Department of Agriculture, and other agencies.

Guided by your requests, we have tried to put as much useful data in this report as possible. We have not, therefore, given any interpretation of the material, and we have kept the tables as simple and clear as possible. By comparing your county in various respects with other counties and with the state as a whole, you will, we hope, better understand the present situation and be more able to plan for the future.

If you need help either in interpreting the data given here or in securing more detailed information, write to the Department of Rural Sociology, University of Kentucky.

^bThe list of measures used to form the composite index is as follows: Percentage of persons 25 years old and over who completed high school, 1950. Percentage of employed persons engaged in professional and related services. Percentage of total population "urban," 1950. Vehicles per mile of state-maintained road, 24 hour period, 1952. Instructional expenditures per pupil in average daily attendance at school, 1953. Percentage of total births delivered in hospital. Percentage of dwelling units with hot running water, with private toilet and bath, and not dilapidated 1950. Full value of taxable real estate per capita, 1952. Population per physician, 1953. Residence telephones per 100 population. Percentage of school census children in average daily attendance at school, 1953. Daily newspapers circulated per 100 population, 1952. Effective fertility ratio (children under 5 per 1,000 females 20-44 years old, inclusive) 1950. Per capita income, 1952. Percentage of total births delivered by a physician, 1951. Percentage of dwelling units reporting central heating equipment, 1950. Percentage of employed persons engaged in service employment, 1950. (pp. 6-7, ibid.)

^cHere "is the ranking of counties, beginning with those which are most urban, according to the composite index built from the merger of all the items. In reading the table notice that seven counties tie for the classification 'most urban,' so each is given a rank of 4; nine counties tie for the 'next most urban,' so each gets a rank of 12. At the end of the distribution nine counties tie for 'most rural' (or least urban), so each had a rank of 116." (p. 7., ibid.)

^b"The replacement ratio is the ratio of the expected number of entrants into the specified working age group during the decade to the expected number of departures resulting from death or from reaching retirement age during the decade." (p. 1, ibid.)

"For the working age population a replacement ratio of more than 100 indicates that more than full replacement of men leaving the working age would occur if none of the population reaching working age migrates. A ratio of less than 100 indicates that if the number in the working age is to be maintained, migration into an area must occur." (p. 2, ibid.)

^aThe six items were cash expenditures for machine hire, hired labor, feed for livestock and poultry, gasoline and other fuel, commercial fertilizer, lime and liming materials.

^bSource: 1954 U. S. Census of Agriculture.

^cThis figure was derived by dividing the total cash expenditures for the six items specified by the total acres of farmland in each county.
