**LIBRARY**  
**UNIVERSITY OF KENTUCKY**

**FOREWORD**

The information contained in this bulletin deals with the financial support, financial ability, and inequalities existing in the various school districts of the Commonwealth. This bulletin follows the same pattern as others published in April, 1939, and January, 1941. If these earlier bulletins are used in connection with the present publication, certain tendencies and trends may be seen and evaluated. This bulletin was prepared by Mr. George L. Evans, Director of the Division of Finance. Because of the importance of the information contained herein, I earnestly solicit your careful consideration of the facts presented and invite your comments and suggestions.

J. W. BROOKER,  
*Superintendent Public Instruction*

## **FINANCIAL SUPPORT, FINANCIAL ABILITY, AND INEQUALITIES EXISTING IN VARIOUS SCHOOL SYSTEMS IN KENTUCKY**

### **Introduction**

This bulletin is published to release information and data concerning the public school system of Kentucky. Data and treatment are divided into three sections. Part I deals with the number of teachers and teachers' salaries for the school year 1942-43. Part II gives information concerning the teaching term of all teachers in all districts for the school year 1942-43. Part III is given over to information concerning financial support of education in Kentucky by both the state and local districts for 1942-43. All information and data are reducible to records and reports now on file in the State Department of Education.

### **Part I**

There are 18,180 teaching positions in Kentucky, as shown by the salary schedules of all districts for 1942-43. This represents a reduction in the number of teachers from 1940-41 of 691. With the teacher scarcity, this reduction is readily understandable. Of the 18,180 cases, 12,239 are employed in county school districts, 1,131 in independent school districts not embraced in cities of the first four classes, and 4,810 in cities of the first four classes.

*Method of treatment*—The salary schedule for every school district was considered. All monthly salaries have been translated to annual salaries. The salary of each individual teacher has been classified as to race, sex, teaching level and annual salary interval.

Referring to Table 1, it is seen that the typical teacher in the county system receives \$661 per year. This is an increase of \$50 over 1940-41. By referring to Table 2, it is seen that the typical teacher's salary in independent school districts not embraced in cities of the first four classes is \$912, or an increase of \$75 annually over 1940-41. The annual salary for the typical teacher in districts embraced by cities of the first four classes is \$1,353, or an increase over the same period of \$67 annually—Table 3. The median salary for all teachers in all districts, as shown by the salary schedules of all teachers for 1942-43 is \$782—Table 4. This represents an increase of \$65 annually. By further inspecting this Table, it is noted that 1,229 teachers receive less than \$500 per year, which means that these teachers receive a weekly wage of \$9.61, or less, for 52 weeks. Anyone who will stop to analyze these facts will readily see that it is impossible for these teachers to maintain a decent living standard, much less leave any surplus for professional growth.

This can mean only one of two things: (1) the teacher is poorly trained or (2) teaching is a side-line with the teacher receiving an income from other sources, either in the form of personal assistance from parents or relatives, or that the teacher is expending a part of her energy in other work. In either event, the teaching profession does not support her, and it is doubtful whether the profession is benefited as much as it should be by her services. However, the figure of 1,229 is comparable to 2,398 cases for the study made for the school year 1940-41.

In Table 5, data are treated with only one result in view; namely, to show the number of men teachers and the number of women teachers and the salary interval into which each falls. Note that of the 18,180 teachers, only 4,190 are men. This number of men teachers should be compared to 5,973 for the same study made two years ago. Further inspection of this Table shows that the median salary of all men teachers is \$905, while the median salary of all women teachers is \$761. The present study shows an increase for both groups. However, the increase for the men is more pronounced than it is for the women. This fact has been occasioned by many men teachers entering the Armed Forces and war work, leaving more mature men in the higher paid brackets. With the corresponding reduction in the number of men, the median has been influenced considerably.

Table 6 is displayed to show the number of white teachers and the number of colored teachers with corresponding medians.

In Table 7, these data have received such treatment as to show the number of elementary teachers and the number of high school teachers. The treatment herein does not take into consideration sex or teaching positions. It is desirable to point out that the typical elementary teacher receives an annual salary of \$676, whereas a typical high school teacher receives an annual salary of \$1,139. It is the judgment of the writer that this Table reveals the most discriminatory practice carried on in the education system of Kentucky. Only a fractional part of the difference represented by these two typical salaries is in actual monthly salaries. The greater part of it is brought about because of difference in term length. It has been the general practice in a great many districts to operate the elementary schools for a seven-months period and the high schools for a nine-months term. This fact, when considered in the annual salary of the teacher, reflects considerable difference.

However, it is only fair to point out that included in data supporting the annual salary of the typical high school teacher are principals, coaches, vocational agriculture teachers, and home economics teachers who invariably receive a higher salary than do the other high school

teachers; and that high school teachers are considerably better trained than elementary teachers.

Tables 8, 9 and 10 are given to show the salary classification of all teachers in the Commonwealth. Note that these Tables divide the teachers by race and show the annual salary but do not show the teaching level.

## Part II

The data used in Part II of this bulletin are from the same sources as Part I. All the information has for its foundation the salary schedules of all school districts of the Commonwealth for 1942-43.

*Treatment*—The period of teaching employment for every teacher has been broken into four major sections. Table 11 points out the number of teachers and the teaching terms for the county school districts. Table 12 gives the same information for independent school districts not embraced in cities of the first four classes, while Table 13 reflects the same data and the same treatment for school districts in cities of the first four classes. Table 14 is simply a summary of the data and treatment, and reflects the information concerning term of employment for all teachers in all districts.

Referring to Table 11, it is seen that the range is from seven months to twelve months in county school districts. It is desirable to call to the reader's attention that of the 12,239 teaching positions in the county school system, 6,393 are for seven months. However, this figure, when compared with the 7,168 for 1940-41, does show a slight trend in favor of an increased school term.

Considering this Table again, it is seen that the average term of teacher employment expressed in months in the white elementary schools is 7.47, for the colored elementary schools 7.62, for white high school teachers 9.13, and for colored high school teachers 8.94, and for the total number of county teaching positions 7.82, which is comparable to the 1940-41 figure of 7.79.

Table 12 shows a much more wholesome picture. Of the 1,131 teachers employed in districts of this classification, it is gratifying to note that 1,067 have an employment term of nine months or more. It is interesting to compare the average length of term for the county district and the average length of term of the independent districts not embraced in cities of the first four classes. The average term is 1.28 months longer in these independent districts than in the county districts.

By inspecting Table 13, it is seen that the period of employment for the independent districts embraced in cities of the first four classes is considerably longer than in other school districts. Here, no teacher has a term of employment less than nine months, while the average for this entire group of teachers is 9.59.

Turning to Table 14, it is seen that the typical teacher in the State of Kentucky has a term of employment amounting to 8.36 months. This, when considered with the typical salary of \$782 per year, gives a fair picture of both the inadequate educational opportunity afforded the average pupil and the economic insecurity afforded the typical teacher.

### Part III

All data and information contained in Part III of this bulletin are submitted to show the financial support, financial ability, and inequalities existing in various school systems in Kentucky.

Table 15 is given space to show the per census pupil assessment of corporate and non-corporate property in every county school district. The writer has not considered income from poll tax nor has income from a levy on bank shares been considered, neither has any allowance been made to take care of collection of school taxes and delinquent taxes. Most districts have a poll tax; some do not. Many districts do not request a levy on bank shares. Therefore, in order to keep the foundation data on the same level for all districts, only the assessment as indicated on general property and the assessment of tax-paying franchise corporations have been considered.

In many county school districts, special taxes are levied in sub-districts. The proceeds of such levies have not been considered in this treatment. However, districts that do have special subdistrict taxes are indicated, as pointed out by information—Table 15.

No particular comment is necessary on this Table except to bring to the attention of the reader the two extreme cases which establish the range; namely, that Woodford County has a per census pupil assessment of \$11,074 while Clinton County has a per census pupil assessment wealth of \$328. This represents a range of \$10,746.

Table 16 is displayed to give the same information in independent school districts not embraced in cities of the first four classes as has been given in the counties as set forth in Table 15. Here the range, although enormous, is slightly less pronounced than in the counties. To arrive at this range, compare Anchorage with a per census pupil assessment of \$8,473 with Gatliff with a per census pupil assessment of \$137. The range in this group of districts is \$8,336.

To complete this type of information, Table 17 is displayed, which gives the same information for the independent school districts embraced in cities of the first four classes. For the sake of easy comparison, the cities have been arranged by respective classes. To find the range of \$8,120, compare the assessed per census pupil wealth of Fort Thomas, \$9,135, with Jackson, of \$1,015.

Table 18 is a summary of information contained in Tables 15, 16 and 17. In order to display two measures, both the median and mean are given; also the range is shown for each particular group of districts as well as displaying the same information for the entire public school system of the state.

It is interesting to note that the same relationship expressed by the per census pupil assessed wealth is approximately the same as the relationship expressed in teacher-employment term, as shown in Tables 11, 12 and 13. To illustrate, the median for the assessed wealth per census pupil in the county group is \$1,676; the average teacher employment in the county group is 7.82. For the independent school districts not embraced in cities of the first four classes, the median for the assessed wealth per census child is \$2,050; whereas the average term for teacher employment is 9.10. In independent school districts embracing cities of the first four classes, the median of assessed wealth per census child is \$2,583; whereas the average term in these same districts is 9.59.

Table 19 is displayed to show data and treatment to arrive at one result; namely, to show inequalities in ability to support public education among various county school districts of the state. Very little explanation seems to be necessary for the interpretation of this Table, except to point out the source of the foundation data.

Columns 2 and 3 have for the source data information contained on general budgets received from each of these school districts for the school year 1942-43.

Column 4, which shows the gross income, seems to need little explanation. Possibly it would be well to say again that no allowance has been made for collection of the school tax, nor has any deduction been made for delinquent taxes. However, as pointed out in another part of this bulletin, the proceeds from poll taxes and levies on bank shares have not been considered; therefore, it is the judgment of the writer that for comparative purposes, the gross income here displayed for each district offers an accurate basis for comparison.

Column 7 gives the amount of the state per capita distribution to each district for the current year 1942-43.

Column 10, which shows the maximum levy that may be requested for general school purposes in county districts, is based on authority as found in sections 160.490 Kentucky Revised Statutes, and 160.150, subsection 5, Kentucky Revised Statutes.

Table 20 displays data for the distribution of \$400,000.00 appropriated by the 1942 General Assembly for the purpose of assisting school districts having low ability to support education.
